Bio

Backend/platform engineer building high-throughput analytics systems, event pipelines, and reliable production services. Interested in Linux/NixOS, ML infrastructure, self-hosting, and automation.

PRIOR WORK EXPERIENCE

Software Engineer at OzonTech

11.2024 – Present

Moscow, Russia

Develop services for a BI platform processing billions of events per day, focusing on delivery reliability, resource efficiency, and operational stability. Review backend systems, document operational practices, and contribute to cross-team delivery of analytics and stability features.

- Owned a core real-time attribution service processing millions of events per second.
- Reduced storage footprint by hundreds of TB and CPU demand by hundreds of cores through service- and system-level optimizations.
- Redesigned stress-test data preparation and load-generation workflows to support larger test datasets and more realistic client traffic.

Software Engineer at VK

06.2023 – 11.2024

Moscow, Russia

Worked on high-volume advertising statistics infrastructure, including attribution logic, S2S integrations, and charging.

- Reduced stateful service startup time from minutes to seconds via startup-state bootstrapping.
- Migrated multi-stage event-processing orchestration from a shared database to a dedicated service API, reducing coupling between pipeline components.
- Built a unified entry point for cross-department S2S integrations and coordinated migration across affected teams.

Intern at Sber Robotics Lab

11.2022 – 02.2023

Moscow, Russia

- Built Python desktop tooling for ESP32 configuration, diagnostics, and UART tracing.
- Conducted RGB-D segmentation experiments for robotic suction-gripper automation, including data preparation, model training, and evaluation.

EDUCATION

Higher School of Economics, 01.04.02

09.2023 – 06.2026

Moscow Institute of Math and Electronics.

Master's degree in Applied Artificial Intelligence Models.

Moscow, Russia

Bauman Moscow State Technical University, 09.03.01

09.2019 – 06.2023

Department of Robotics and Complex Automation.

Bachelor's degree in Computer Aided Design.

Moscow, Russia

RESEARCH

Automated Ranking of Soybean Plots from RGB Video

10.2025 – 09.2026

First author. Published in *Sensors* 2026, 26(19), 6171. doi:10.3390/s26196171. Built a video-based ranking pipeline that scores soybean bed quality from close-range RGB by aggregating monocular depth, semantic plant area, and pod keypoint counts.

- Developed and evaluated an end-to-end video-processing pipeline on a controlled dataset across indoor and outdoor scenes.
- Experimented with multiple image annotation automation methods and object detection SFT (YOLO, DETR).
- Suppressed background clutter with Depth Anything 3, distilled zero-shot SAM3 segmentation into a lightweight SegFormer for edge deployment, and estimated pod counts with P2PNet.

TECH STACK

Lang: Go (Golang), Python, C/C++ | **Backend:** gRPC, OpenAPI, SQL, pprof

Data/Infra: Kafka, ClickHouse, Postgres, HDFS, Spark, Airflow, etcd, Kubernetes, GitLab CI/CD, Prometheus, Grafana
